

TOPIC: EXTRA

Alright so I've got an input field, I have no idea what it asks for but I found a hint, let's check it out:

HINT: "The jar awaits a sacred offering, a payload crafted in the ancient form of JSON. The key must be 'token', and the value holds the ancient secret passed down through generations. Encode your offering in base64 to unlock the wisdom of Osiris. Only the one who knows the 'ancient_secret' will reveal the power within."

So, I got a key:value pair it seems..

{ "token": "ancient_secret" } is the JSON but it needs to be encoded

```
echo -n '{ "token": "ancient_secret" }' | base64
```

The Cursed Canopic Jars

"He who tampers with the vessels of the dead shall suffer their fate..."

Deep within the **Temple of Osiris**, four Canopic Jars hold the preserved remains of the Pharaoh's most loyal guardians.

Many have sought their power, but few have returned to tell the tale.

Place an offering:
